Problem 1.51. Let x and y be strings and let L be any language. We say that x and y are **distinguishable by** L if some string z exists whereby exactly one of the strings xz and yz is a member of L; otherwise, for every string z, we have $xz \in L$ whenever $yz \in L$ and we say that x and y are **indistinguishable by** L. If x and y are indistinguishable by L, we write $x \equiv_L y$. Show that $\equiv_L$ is an equivalence relation.

Proof. To show that $\equiv_L$ is an equivalence relation, first give formal definition of $\equiv_L$[1], and then show that $\equiv_L$ is:

1. Reflexive

2. Symmetric

3. Tranisitive

Definition $\equiv_L$**.** Let x and y be strings and let L be any language. Then $x \equiv_L y$ is defined as

$$(x \equiv_L y) \equiv (\forall z \mid : xz \in L \equiv yz \in L).$$

Part 1. Reflexivity: $x \equiv_L y$

Part 2. Symmetry: $x \equiv_L y \Rightarrow y \equiv_L x$

Proof by assuming conjuncts of the antecedents.

$$
\begin{aligned}
&\quad y \equiv_L x \\
=&\quad \langle Definition\ of\ \equiv_L \rangle \\
&\quad (\forall z \mid : yz \in L \equiv xz \in L) \\
=&\quad \langle Symmetry\ of \equiv (3.2) \rangle \\
&\quad (\forall z \mid : xz \in L \equiv yz \in L) \\
=&\quad \langle Definition\ of\ \equiv_L \rangle \\
&\quad x \equiv_L y \\
=&\quad \langle Assumption\ x \equiv_L y \rangle \\
&\quad true
\end{aligned}
$$

Part 3. Transitivity: $x \equiv_L y \wedge y \equiv_L w \Rightarrow x \equiv_L w$

---

[1]The formal method used in this proof is presented in the book **A Logical Approach to Discrete Math** by David Gries and Fred B. Schneider.
